

Is your **healthy baby** at risk for

PNEUMOCOCCAL DISEASE?

Learn more about a clinical research study.

Researchers are studying an investigational vaccine that may protect against pneumococcal disease. Pneumococcal disease is caused by a type of bacteria that is a major cause of infections in the ears, sinuses, blood, lungs, or brain.

Researchers will test the safety of the study vaccine.

Children born prematurely will be included in a sub-study to see how their bodies handle the study vaccine and to determine if there are differences in the response to the study vaccine compared to a vaccine that is already approved.

Your baby may qualify for this study if he or she is 42-90 days old when beginning the study and:

- Is healthy based on medical history and a physical examination.
- Has not received a dose of any pneumococcal vaccine.
- Has a parent or legal guardian who agrees the study doctor or staff may be in contact while his or her child is in the study.

There are additional eligibility criteria that the study doctor can discuss with you.
