Discontinuation of Home Isolation for Persons with COVID-19 (Interim Guidance)

## For Persons with COVID-19 Under Home Isolation:

The decision to discontinue home isolation should be made in the context of local circumstances. Options now include both 1) a time-since-illness-onset and time-since-recovery (non-test-based) strategy, and 2) a test-based strategy.

## Time-since-illness-onset and time-since-recovery strategy (non-testbased strategy)

- a. Persons with COVID-19 who have symptoms and were directed to care for themselves at home may discontinue home isolation under the following conditions:
  - At least 3 days (72 hours) have passed since recovery defined as resolution of fever without the use of fever-reducing medications and improvement in respiratory symptoms (e.g., cough, shortness of breath); and,
  - ii. At least 7 days have passed since symptoms first appeared.

## 2) Test-based strategy (simplified from initial protocol)

- Note: previous recommendations for a test-based strategy remain applicable; however, a test-based strategy is contingent on the
  - availability of ample testing supplies and laboratory capacity as well as convenient access to testing. For jurisdictions that choose to use a test-based strategy, the recommended protocol has been simplified so that only one swab is needed at every sampling.
- Persons who have COVID-19 who have symptoms and were directed to care for themselves at home may discontinue home isolation under the following conditions:
  - i. Resolution of fever without the use of fever-reducing
  - Improvement in respiratory symptoms (e.g., cough, shortness of breath) and
  - iii, Negative results of an FDA Emergency Use Authorized molecular assay for COVID-19 from at least two consecutive nasopharyngeal swab specimens collected ≥24 hours
