

How the Market and Supply Work

As the market price (including the cost of conversion) increases, the expected

quantity of electricity to be sold in the market (including the conversion capacity) that will be sold will be greater than the amount of supply in the market. To make electricity supply and demand balance, the market will usually increase the market clearing price from today.

1. **Electricity sold with generation will be less than the amount of electricity generated from conversion with the current market clearing price.**

2. **Electricity sold with generation will be greater than the amount of electricity generated from conversion with the current market clearing price, which is the market clearing price with the current market clearing price. To make electricity supply and demand balance, the market clearing price will increase from today.**

3. **Electricity sold with conversion capacity is greater than the amount of electricity generated from conversion with the current market clearing price. To make electricity supply and demand balance, the market clearing price will decrease from today.**

4. **For any electric generation capacity, selling more electricity is defined as being defined as "sell out" and "sell out" means "sell out" and "sell out" means "sell out" and "sell out" means "sell out".**

As power generation increases from today when a generator is sold, the supply will be less than the amount of electricity to be sold. To make electricity supply and demand balance, the market clearing price will increase from today. To make electricity supply and demand balance, the market clearing price will increase from today.

As power generation increases from today when a generator is sold, the supply will be less than the amount of electricity to be sold. To make electricity supply and demand balance, the market clearing price will increase from today.

As power generation increases from today when a generator is sold, the supply will be less than the amount of electricity to be sold. To make electricity supply and demand balance, the market clearing price will increase from today.

Thank you.

Thank you.
