

The content of your app, or **content**, may be a page with text or a Web page with a form to go and do something else. In this case, you use the `Text` widget and `TextForm` widget, and you also use the `Text` widget to set up the text of the `TextForm` widget. In this example, we use the `Text` widget to set up the text of the `TextForm` widget. The `Text` widget has a `text` property that you can use to set the text of the `TextForm` widget. The `Text` widget also has a `text` property that you can use to set the text of the `TextForm` widget.

Instructions

1. Get the `Text` widget from the `Text` widget. The `Text` widget is a widget that displays text.
2. Create a `TextForm` widget.
3. Use the `Text` widget to set the text of the `TextForm` widget. You can use the `Text` widget to set the text of the `TextForm` widget. You can use the `Text` widget to set the text of the `TextForm` widget.

4. **Make the form work:** Use the `Text` widget to set the text of the `TextForm` widget.
