

The process of user sign-up, or **registration**, is a key element of any performance-driven or goal-oriented app. And there's much you can do to help promote and optimize this key step. Here's how to set up a sign-up screen with React Native. In this step-by-step tutorial, we'll create a simple mobile app that will collect user information and store it in a database. We'll also see how to use a third-party library to help with the database part of the app.

## Prerequisites

1. You'll need to have a basic understanding of JavaScript and React Native.
2. You'll need to have a basic understanding of databases and how to use a third-party library to help with the database part of the app.
3. You'll need to have a basic understanding of how to use a third-party library to help with the database part of the app.

4. **Mobile User Profile** [1] will be used to store user profile information.
