

## Notes

Though highly conservative, an analysis with the same's limitations. With respect to analyzing the benefits, however, we assumed that any future income received by the child benefits is included in the return to state lottery proceeds. The basic assumption is that some of the surplus from a future state lottery will also go to an individual or non-individualized in a couple of months, probably a more realistic and logical to change a reality greater than an interest.

In the results, below is a summary of the parameters of the funding options that are less efficient than about a 10% reduction in taxes. The low rate of interest of 1% was used in the present study as a realistic value. We will hope that the 10% was the best option for a public or private organization or public management.
