

When the plant is in the vegetative phase, when given a high concentration of auxin, it will produce an abscisic acid-like compound. This compound will be transported through the plant and will cause the plant to stop growing and to produce a dormancy-like state. This is the mechanism by which the plant can survive in a dormant state.

[[Auxin transport - In the plant, auxin is transported from the shoot to the root and vice versa.]]

Question on top - 10/10/2020, 10/10/20

10/10/2020 change summary:

1. The first is a very general one. It has been shown that auxin is a key factor in the growth of plants. It is a hormone that is produced in the shoot and is transported to the root. It is a hormone that is produced in the shoot and is transported to the root. It is a hormone that is produced in the shoot and is transported to the root.
2. **10/10/2020 change summary:**
 1. The first is a very general one. It has been shown that auxin is a key factor in the growth of plants. It is a hormone that is produced in the shoot and is transported to the root. It is a hormone that is produced in the shoot and is transported to the root.
 2. The second is a more specific one. It has been shown that auxin is a key factor in the growth of plants. It is a hormone that is produced in the shoot and is transported to the root. It is a hormone that is produced in the shoot and is transported to the root.
 3. The third is a more specific one. It has been shown that auxin is a key factor in the growth of plants. It is a hormone that is produced in the shoot and is transported to the root. It is a hormone that is produced in the shoot and is transported to the root.

10/10/2020 change summary:

1. The first is a very general one. It has been shown that auxin is a key factor in the growth of plants. It is a hormone that is produced in the shoot and is transported to the root. It is a hormone that is produced in the shoot and is transported to the root.
2. The second is a more specific one. It has been shown that auxin is a key factor in the growth of plants. It is a hormone that is produced in the shoot and is transported to the root. It is a hormone that is produced in the shoot and is transported to the root.
3. The third is a more specific one. It has been shown that auxin is a key factor in the growth of plants. It is a hormone that is produced in the shoot and is transported to the root. It is a hormone that is produced in the shoot and is transported to the root.
4. The fourth is a more specific one. It has been shown that auxin is a key factor in the growth of plants. It is a hormone that is produced in the shoot and is transported to the root. It is a hormone that is produced in the shoot and is transported to the root.
5. The fifth is a more specific one. It has been shown that auxin is a key factor in the growth of plants. It is a hormone that is produced in the shoot and is transported to the root. It is a hormone that is produced in the shoot and is transported to the root.
6. The sixth is a more specific one. It has been shown that auxin is a key factor in the growth of plants. It is a hormone that is produced in the shoot and is transported to the root. It is a hormone that is produced in the shoot and is transported to the root.
7. The seventh is a more specific one. It has been shown that auxin is a key factor in the growth of plants. It is a hormone that is produced in the shoot and is transported to the root. It is a hormone that is produced in the shoot and is transported to the root.
8. The eighth is a more specific one. It has been shown that auxin is a key factor in the growth of plants. It is a hormone that is produced in the shoot and is transported to the root. It is a hormone that is produced in the shoot and is transported to the root.
9. The ninth is a more specific one. It has been shown that auxin is a key factor in the growth of plants. It is a hormone that is produced in the shoot and is transported to the root. It is a hormone that is produced in the shoot and is transported to the root.
10. The tenth is a more specific one. It has been shown that auxin is a key factor in the growth of plants. It is a hormone that is produced in the shoot and is transported to the root. It is a hormone that is produced in the shoot and is transported to the root.
