

Help us discover a way to expand protection for the next generation

Childhood vaccinations protect against many serious diseases, so it's important to make sure your baby receives routine vaccinations at the recommended ages. Advances in medical science mean these vaccinations provide some protection, but we are looking to expand this.

The NeXXstep 13 Study is a vaccine research study, which will learn about the safety of an investigational pneumococcal vaccine compared with an approved pneumococcal vaccine. Would you be interested in learning more about it?

The NeXXstep 13 Study may be an option for healthy babies who:

- are 6 to 14 weeks of age
- have not yet received a pneumococcal vaccination

For more information, please contact:

Mykayla Miya, CRC
