

Compassion • Courtesy • Respect

Dear Parent,

Hello! I'd like to tell you about a research study that my team and I are running at our office.

GlaxoSmithKline (GSK) is sponsoring a research study to test the immune response and safety of a meningitis B vaccine. In the US, the GSK meningitis B vaccine is approved by the Food and Drug Administration (FDA) for people ages 10 to 25 years.

Meningitis B is an infection that can cause serious harm to the brain, spinal cord, and blood. It's a rare disease but life-threatening and can lead to death or life long disability.

In the study, we will enroll infants aged 6 to 12 weeks and therefore the use of the meningitis B vaccine is investigational. Here's some important information about the study:

- Your baby's time in the study will last 22 months*
- Over that time, there will be 7 in-office visits and 13 phone calls*
- There are 3 blood draws: at 7, 12, and 13 months of age*
- Participation is your personal decision and completely voluntary*
- You will be compensated \$100 for each completed in-office visit*

Please contact our Lead Study Coordinator Kimm Ericksen at 801.773.4840 ext. 3639 or Eva Pitchford at 801.773.4840 ext. 3642 for more information about joining the study.

Kind Regards,

*Brent Eberhard, MD
Nathan Forbush, MD
Davin Hansen, PA-C
Adam Hutchinson, MD*
